# COMPUTER SCIENCE PROJECT
# TERM-II 2022-23

## TOPIC:

# OTT APPS SUBSCRIPTION MANAGEMENT

NAME:
CLASS:
SECTION:
ROLL.NO:

# BONAFIDE CERTIFICATE

Certified to be the Bonafide Project work in COMPUTER SCIENCE done by_____, Registration Number _____ of Class XII Section A of D.A.V GIRLS SR.SEC. SCHOOL, GOPALAPURAM, CHENNAI – 600086 during the year 2022-2023.

Signature of Principal Signature of Subject Teacher

School Seal

Submitted for the Practical Examination held on _____ at D.A.V.GIRLS SR. SEC. SCHOOL, GOPALAPURAM, CHENNAI – 86

Internal Examiner External Examiner

# AIM OF THE PROJECT

Subscription management is the art of handling customer's subscription life cycle from start to finish. It starts when a customer signs up/signs in for their favorite ott app subscription and ends at the point where they can renew or cancel the subscription. It also involves making sure that customers are happy with your service.

Subscription management, on the other hand, deals with your existing customers and the ongoing process of ensuring that they stay with your service.

In today's world, everyone are using ott apps. To make this an easy task for the users we are having subscription management.

If the user is already a member of their ott platform they can:

1. login
2. iew their previous plan
3. change to new plan
4. iew the available plans of their ott platform
5. renew or delete their account

To organize the subscription management we have admin mode. It ensures that it keeps record of the ott app subscribers.

In the admin mode, the admin can:

1. iew all the subscribers
2. change the validity of the new subscriber
3. If validity expires, asks the user if they want to renew/delete their account
4. Add new subscriber
5. Delete the subscriber

# SQL TABLES USED

```
mysql> select * from subscribers;

## USER DEFINED FUNCTIONS USED

- def CREATETABLE_AMAZONPRIME():
  This udf function is used to create table amazon prime .
  Plan , Membership price, validity inserted into amazon prime table
- 2. def CREATETABLE_NETFLIX():
  This udf function is used to create table netflix
  Plan, pricemonthly, No of screens ,Type of device inserted into Netflix table
- 3. def CREATETABLE_SUBSCRIBERS():
  This udf function is used to create table subscribers
  Username, user id, ott platform, plan, validity inserted into subscriber table
- 4. def CREATETABLE_HOTSTAR():
  This udf function is used to create table hotstar
  Plan, price, validity, number of devices, resolution supported inserted into hotstar table
- 5. def CREATE_ZEE_TABLE():
  This udf function is used to create zee table
  plan, price, duration, screens inserted into Zee table
- def view_previousplan(id):
  this udf function is used to view the previous plan of the subscriber using the user id
- def change_userplan(id):
  This udf function asks for the plan to be changed from the user and updates the plan of the subscriber in table subscribers using user id
  Shows the table after updation
- def delete_user(id):
  This udf function is used to delete the subscriber using the user id
- def netflix_plans():
  this udf function is used to show the plans in the Netflix table
- def amazonprime_plans():
  this udf function is used to show the plans in the amazonprime table
- def validity_change(id):
  This udf function updates the validity of the subscriber in the subscribers table according to the chosen plan with the user id
- def renew_acc(id):

this udf function us used to renew or delete the account when the validity of the plan is over
if the user wants to renew their account with the same plan, the validity of the subscriber in the subscriber table is updated accordingly

- def netflix_user():
  This udf function is used to do the following:
  - to login:
    asks the user to enter user id, name, user id
    if the user id is in table subscribers login is successful
    it allows the user to view the previous plan details, the Netflix plans, to change the user plan, to delete the user plan or renew their account
    if the user id doesn't match something went wrong
  - If new to Netflix-sign in
    To create a new Netflix account the user id, user name, email id, password and the plan is inputed and inserted into the table subscribers
- def amazonprime_user():
  This udf function is used to do the following:
  - to login:
    asks the user to enter user id, name, user id
    if the user id is in table subscribers login is successful
    it allows the user to view the previous plan details, the Amazonprime plans, to change the user plan, to delete the user plan or renew their account
    if the user id doesn't match something went wrong
  - If new to Amazonprime-sign in
    To create a new Amazonprime account the user id, user name, email id, password and the plan is inputed and inserted into the table subscribers
- def hotstar_plans():
  this udf function is used to show the plans in the hotstar table
- def hotstar_user():
  This udf function is used to do the following:
  - to login:
    asks the user to enter user id, name, user id
    if the user id is in table subscribers login is successful

it allows the user to view the previous plan details, the hotstar plans, to change the user plan, to delete the user plan or renew their account
if the user id doesn't match something went wrong

- If new to hotstar-sign in
  To create a new hotstar account the user id, user name, email id, password and the plan is inputed and inserted into the table subscribers

- def zee_plans():
  this udf function is used to show the plans in the zee table
- def zee_user():
  This udf function is used to do the following:
  - to login:
    asks the user to enter user id, name, user id
    if the user id is in table subscribers login is successful
    it allows the user to view the previous plan details, the zee plans, to change the user plan, to delete the user plan or renew their account
    if the user id doesn't match something went wrong
  - If new to zee-sign in
    To create a new zee account the user id, user name, email id, password and the plan is inputed and inserted into the table subscribers

- def view_allsubscriber():
  This udf function is used to do the following:
  1. View all ott apps subscriber
  2. View Netflix subscriber
  3. View amazon prime subscriber
  4. View hotstar subscriber
  5. View zee subscriber
- def delete_expiredrecord():
  This udf function is used to allow the user to renew their account plan or delete their account if the validity of the subscriber plan is less than the current date
- def new_subscribervalidity():
  This udf function is used to update the validity of the new subscriber according to their chosen plan

- def add_subscriber():
  This udf function asks the subscriber for name, user id, email id, ott platform, validity and insert into the table subscribers
- def delete_subscriber():
  This udf function asks for the user id from the subscriber and deletes their record from the table subscribers
- def admin():
  This udf function is used to
    1. view all subscribers
    2. update the validity for the new subscriber
    3. delete the records whose validity date expired
    4. add new subscriber
    5. delete a subscriber
- def user():
  This udf function is used to call all the user udf functions using a menu driven code
